**A1-WWT09: TWO COLUMNS OF DATA—DATAGRAPH**

A student uses data from a table to make a graph as shown.

What, if anything, is wrong with this graph? If something is wrong, identify and explain how to correct all errors. If this statement is correct, explain why.

*Answer: The student hasn't used a uniform interval for the values on the y-axis, so the graph of the data is misleading. Since the largest y-value is 14.0, we could choose an interval of 2 for the y-axis, and then a plot of the data would look like:*

**A2-SCT14: COMBINING TWO VECTORS—RESULTANT**

Two vectors each have a magnitude of 6 units, and each makes a small angle  $\alpha$  with the horizontal as shown. Four students are discussing the resultant vector obtained by adding these two vectors.

- Amanda: "Since these are vectors, we need to use the Pythagorean theorem to find the magnitude. In this case, the magnitude will be the square root of 72. The direction will be downward."
- Belle: "Since these are vectors we have to find a direction and a magnitude. We use the vectors to determine the direction, which is down. But to get the magnitude, we just add the individual magnitudes. The magnitude of the resultant is 12."
- Conrad: "I think the direction is actually up. The resultant should add to these vectors to get zero, and since these two point down, we need another vector pointing up."
- Donald: "The magnitude will be less than six. Each of these points down just a little, so the resultant will be pretty small."

With which, if any, of these students do you agree?

Amanda  Belle  Conrad  Donald  None of them

Explain your reasoning.

*Answer: Donald is correct.*

*The resultant can be found by vector addition as shown here. The resultant points down and is smaller than either individual vector. However, Donald neglects to specify the direction, which is down as Amanda and Belle correctly point out.*
